Carve Field Guide

This document is a **working reference**: one plain-text Carve source that exercises every construct in the PDF renderer profile and the newest CSS-only recipes, then prints to a clean PDF. It doubles as the coffee handbook for *Carve Coffee Roasters* — because a reference is easier to read when it actually says something.

Text carries the usual inline marks: **bold**, *italic*, underline, highlighted, inserted, ~~deleted~~, ~~struck~~, `inline code`, super^script^ and sub~script~, plus an abbreviation like HTML (HyperText Markup Language) and a keyboard hint `Ctrl` + `C`. Smart typography turns “straight quotes” curly, ‘single’ too, and — / – into proper dashes. Revision marks also express a replacement: the ~~old recipe~~new recipe wins.

Origin and tasting

Coffees from a *single* farm, washing station, or co-operative — never blended. Each lot tastes of its place: the soil, the altitude, the process.

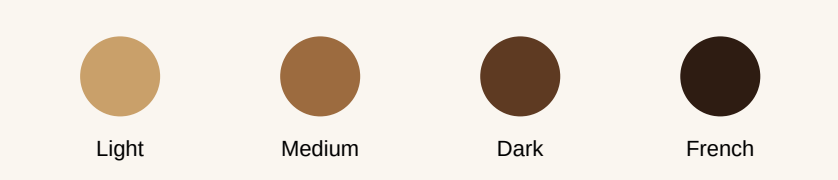

Figure 1: the four roast stages, lightest to darkest

> *We roast light to let origin speak. No dark, no bitter, no hiding behind the roast — only the character of the bean.*
>
> > *And yes, that is a nested blockquote.*

> **House style**
>
> New lots land every few weeks. Roast dates are printed on every bag, and we ship within 48 hours of roasting.

The address on every bag, as a line block:

Carve Coffee Roasters
14 Kaffeegasse
Vienna, AT

Brew methods

Ordered steps for a pour-over (note the list starts at 1, then a custom-start list):

1. Rinse the filter, preheat the carafe.
2. Add grounds, make a shallow well.
3. Bloom with twice the coffee weight.

Continuing the same recipe, renumbered:

4. Pour in slow, steady spirals.
5. Let it draw down fully.

A checklist you can actually tick:

- [x] beans weighed
- [x] water at 94 °C
- [ ] second pour
- [ ] tasted and logged

A pipe table with per-column alignment:

Method	Ratio	Grind
V60	1:16	Medium-fine
Aeropress	1:14	Fine
Batch brew	1:17	Medium

A compact span table uses `^` to continue the cell above and `<` to merge left:

Bar	Mon	Tue	Total
Vienna	12	15	27
Prague	8	11	19
	20		46

The same data as a `list-table` (renders to a real table under the faithful renderer):

Recipe by method

Method	Time
V60	2:45
Aeropress	1:30

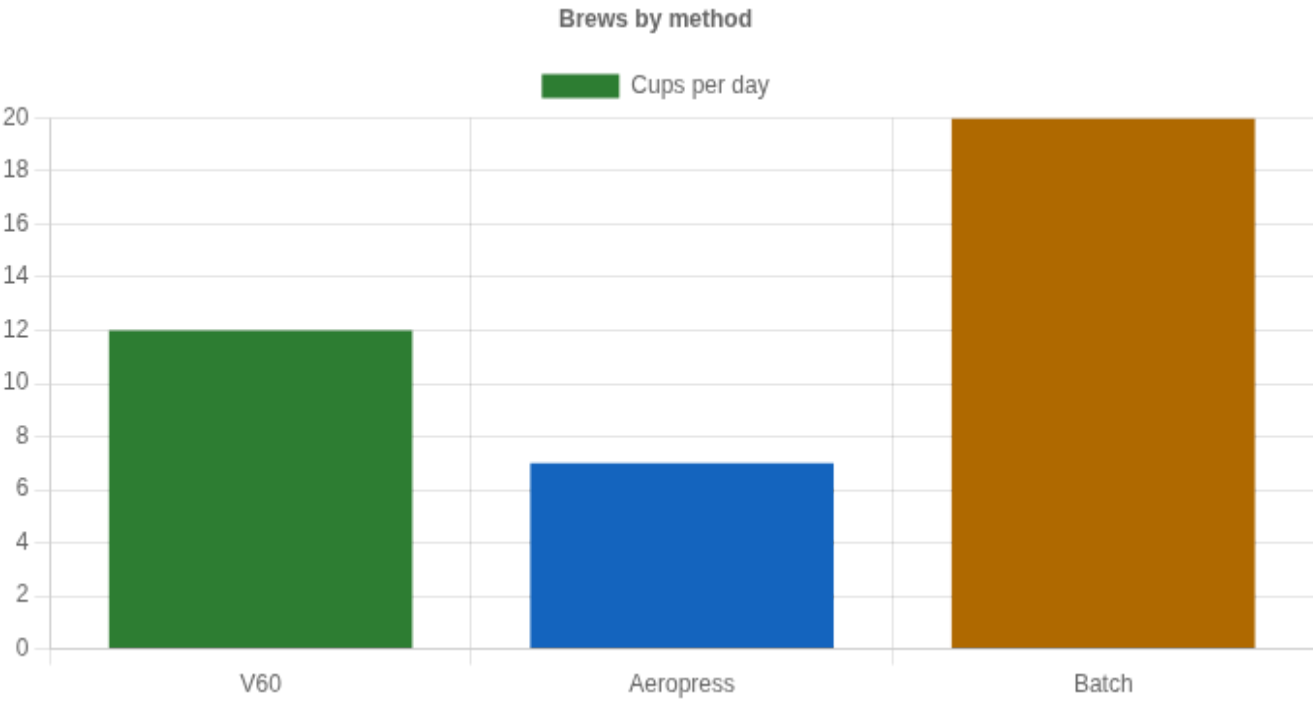

> **Brew it bright**
>
> Keep the water just off the boil (94 °C) and don’t over-extract — the florals fade fast.

> **Storage**
>
> Keep the bag sealed and away from light. Whole bean stays bright for about three weeks.

A Mermaid diagram (typeset to SVG at print time):

A Chart.js chart (Chart config as JSON, drawn to a canvas at print time):

Reference

A definition list:

Washed

Natural

: Fruit removed before drying — clean, bright cups.

: Dried in the whole cherry — heavier, fruit-forward cups.

Named code fences are highlighted before printing. A PHP block:

```php
<?php
$html = (new CarveConverter(safeMode: true))->convert($source);
```

A `code-group` (tabs flatten to labeled sections in print):

composer

```bash
composer require markup-carve/shopware-carve
```

git

```bash
git clone https://github.com/markup-carve/carve-php
```

Carve

```carve
::: tip "Highlighted Carve"
Use *semantic source* with [links](https://markup-carve.github.io/carve/),
{=marks=}, and `code`.
:::
```

A `tabs` block:

Tab 1

Storefront

Rendered server-side through the Twig `|carve` filter.

Tab 2

CLI

Rendered from a `.crv` file with `carve --html`.

Inline math $c = \sqrt{a^2 + b^2}$ and a display block:

$$\text{extraction } \% = \frac{\text{TDS} \times \text{beverage mass}}{\text{dose}}$$

Layout recipes

The recipe layer turns ordinary semantic Carve into polished layouts without adding parser extensions. The same source remains useful in Markdown and plain text.

A connected project tree

```
coffee-guide/
    beans/
        ethiopia.crv
        colombia.crv
    recipes/
        aeropress.crv
        v60.crv
    assets/
        roast.svg
    README.crv
```

Cards and badges

Source-first - one readable `.crv` file feeds every output.

Print-ready - typography, color, diagrams, and page furniture are embedded.

Portable - PHP and JavaScript backends produce the same document structure.

Release status: stable, quality verified, and output PDF.

Columns and steps

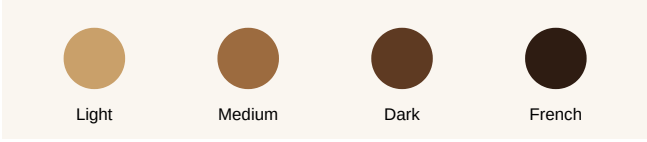

Choose. Pick a freshly roasted coffee whose origin and process sound interesting.

Grind. Start medium-fine, then change one variable at a time after tasting.

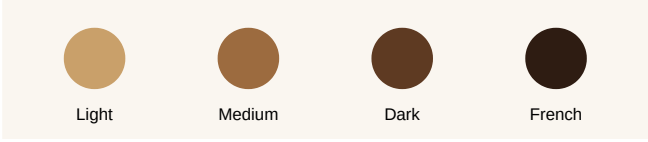

Record. Keep the ratio, temperature, time, and a short sensory note together.

1. Write semantic Carve.
2. Render it through the selected engine.
3. Inline the complete stylesheet and local media.
4. Wait for math, charts, and diagrams, then print.

Gallery, aside, and wide content

Light-to-dark roast development

SVG media remains sharp when enlarged

> **Margin note.** Recipe containers are generic Carve blocks. Their meaning survives even when a target ignores the visual recipe.

This wide callout can escape a deliberately narrow reading measure for diagrams, large tables, or other material that benefits from the full printable width.

Dense and scroll-safe data

Engine	Recipes	Math	Diagrams
PHP	yes	yes	yes
JavaScript	yes	yes	yes
Plain text	semantic fallback	TeX source	diagram source

Processing stage	Input	Output	Preserved quality
Parse	Carve source	AST	document meaning
Render	AST	HTML (HyperText Markup Language) fragment	semantic structure
Compose	fragment + theme	standalone HTML (HyperText Markup Language)	local assets and metadata
Print	ready document	paginated PDF	vectors, links, and color

Notes and fine print

Footnotes come in two flavors: a referenced note[1] and an inline one[2].

A collapsible detail (open in print):

Why rest coffee after roasting?

Fresh-roasted beans off-gas CO2, which disrupts extraction. A 3–7 day rest lets the gas settle so the brew tastes even.

A block spoiler and an inline hidden tasting note:

Cupping score

This lot scored 87.5 on the SCA scale.

Never do this

Do not brew with boiling water straight off the heat — it scorches delicate florals.

Did you know

Autolinked bare URLs work too: https://github.com/markup-carve/carve-php

You’re set

Grind, brew, taste, adjust. Then do it again tomorrow.

You can **@mention** a roaster or tag a **#single-origin** topic inline, and reference-style links like our brew guide resolve from a definition at the bottom.

1. A 1:16 ratio means 1 g of coffee to 16 g of water. ↩

2. the grind matters as much as the ratio ↩
